

# Why you need

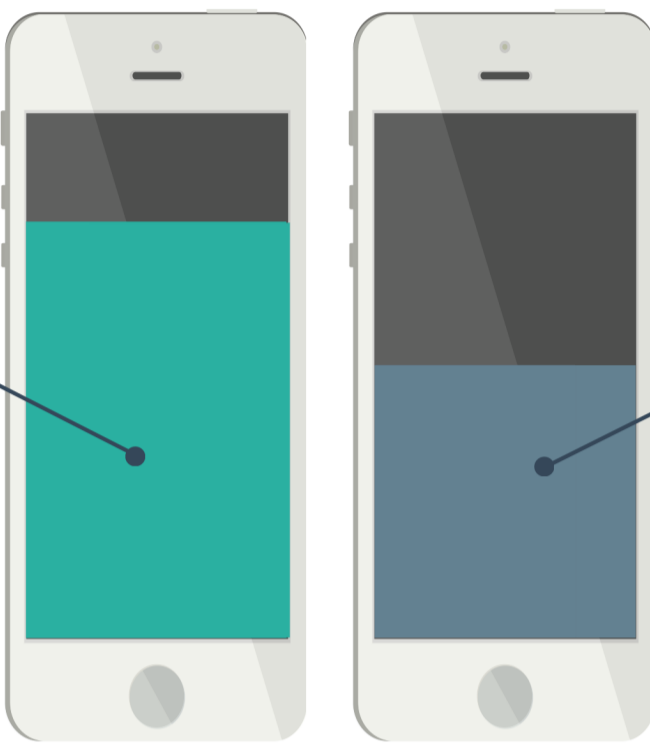

## Mobile Multi-Factor

### Authentication

**Passwords and PINS alone are no longer good enough to protect access to your critical data and applications. With multi-factor authentication through Quick-Factor you can reset your username and password with the one thing you always carry with you- your mobile phone.**

Mobile MFA allows customers to change their passwords quickly and easily without a live agent, freeing up your help desk employees for more valuable customer service calls

#### Increase Efficiency

#### Save Money

Over 30% of calls to IT support are related to password changes. With MFA you eliminate the need for a live agent and gain substantial cost savings.

### 3 Ways to Reset:

#### SMS

Receive one-time use passcodes on your phone by typing them into your secondary login prompt

#### Mobile

Authenticate via login to your smartphone and push notifications

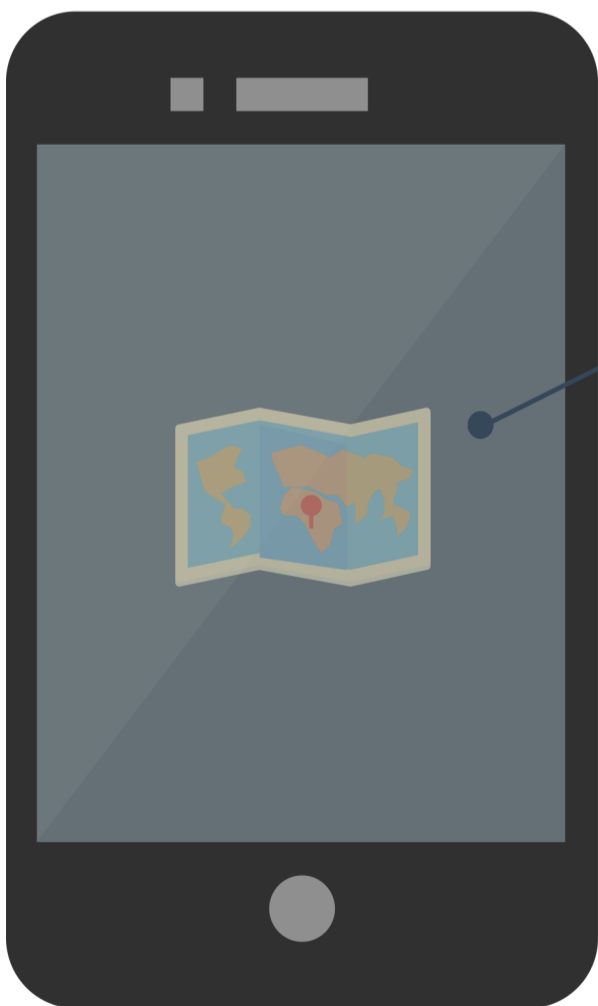

#### Phone

You receive a call then answer and authenticate via key press, challenge and response, and/or voice biometric

#### Reduce Threat Surface

Verifying a caller's identity during the password reset process is essential for security. MFA solutions such as QuickFactor add another layer of security by using voice recognition before proceeding with a password change.
